Data transformation and Data modelling

Step- 1

Importing Data

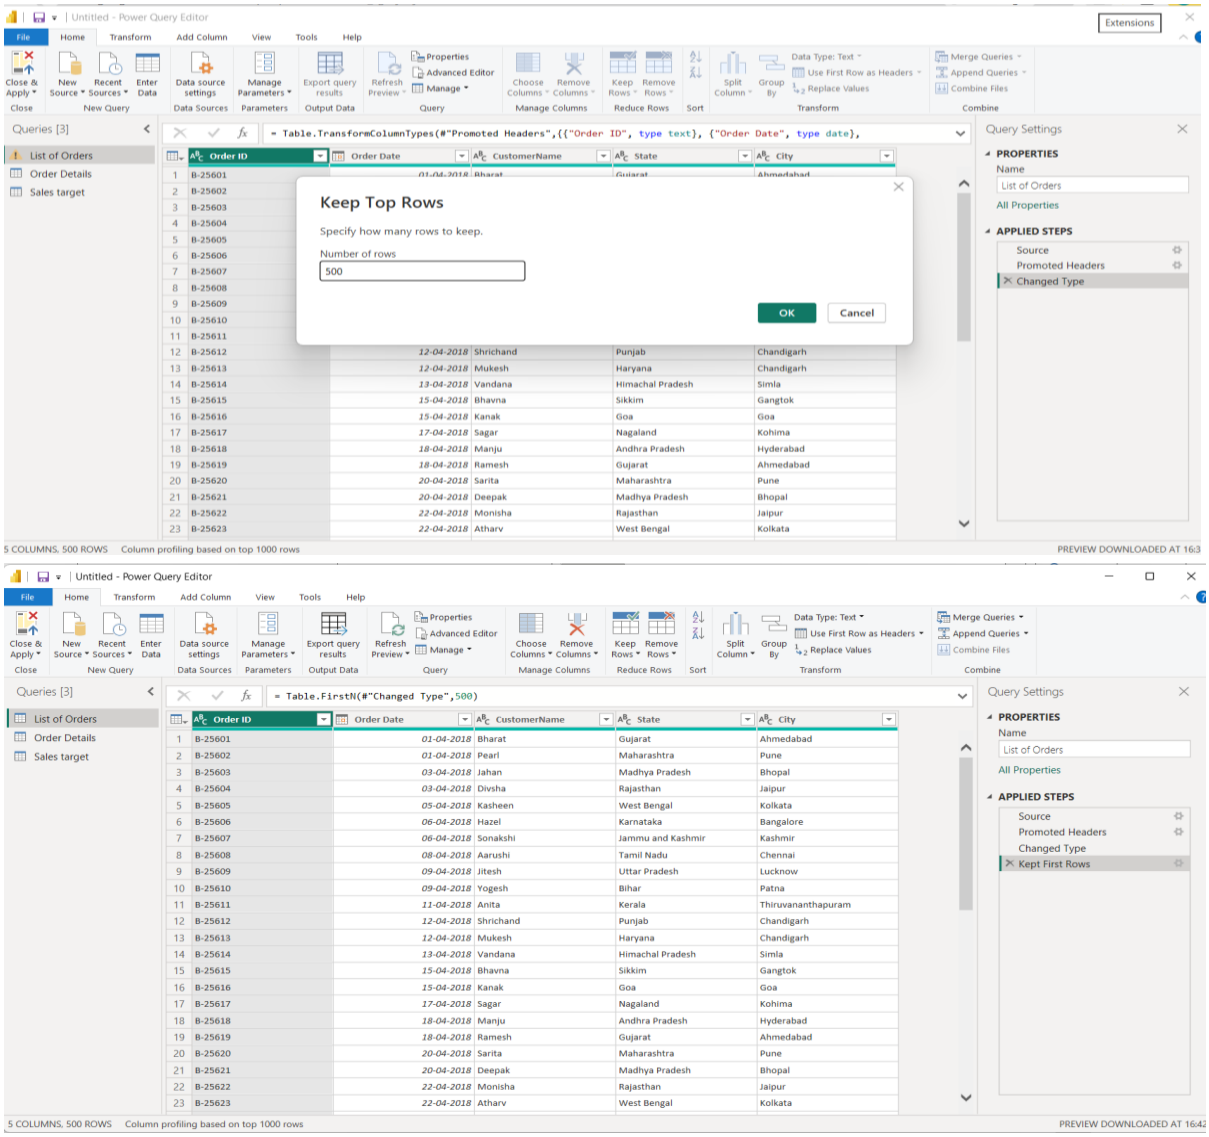

By using the get data Import list of orders, order details, Sales target into Power Bi as a excel workbook

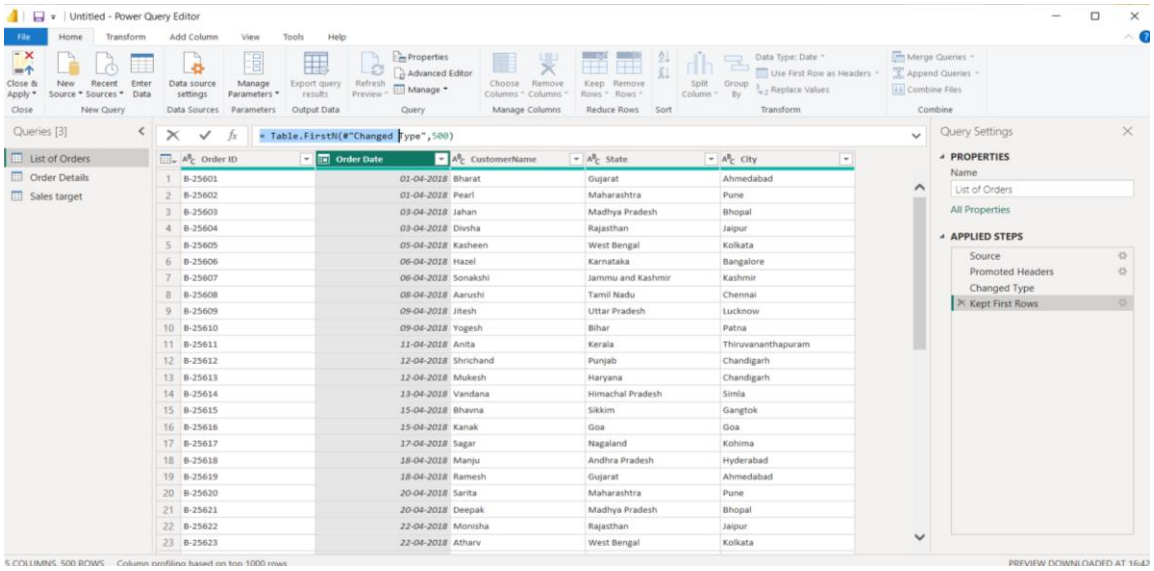

Step- 2

Data Transformation

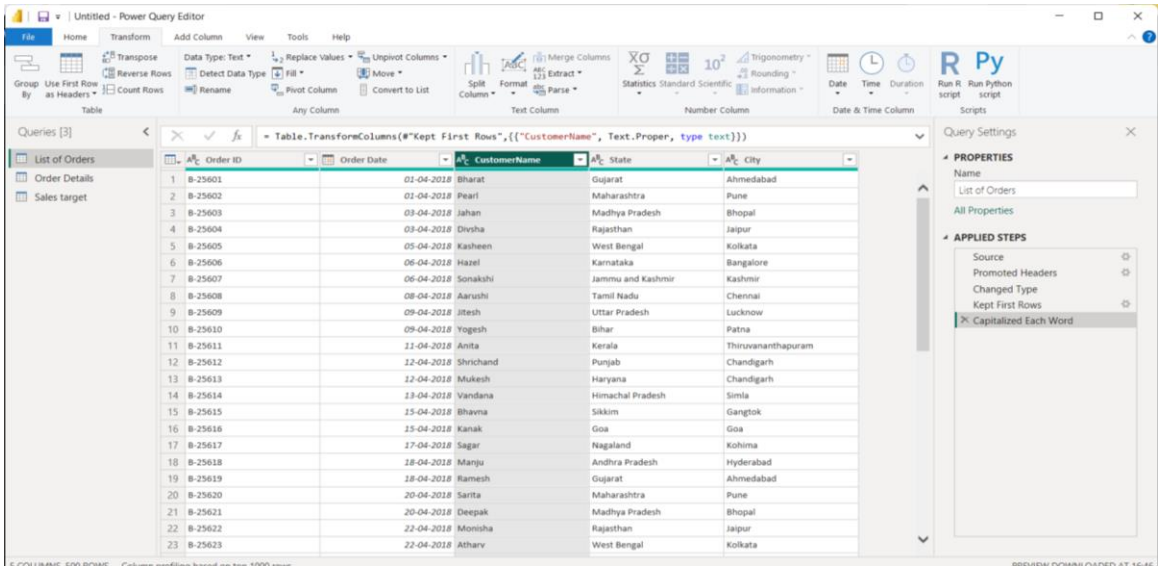

By using Keep rows keep the first 500 rows of List of orders

Step- 3

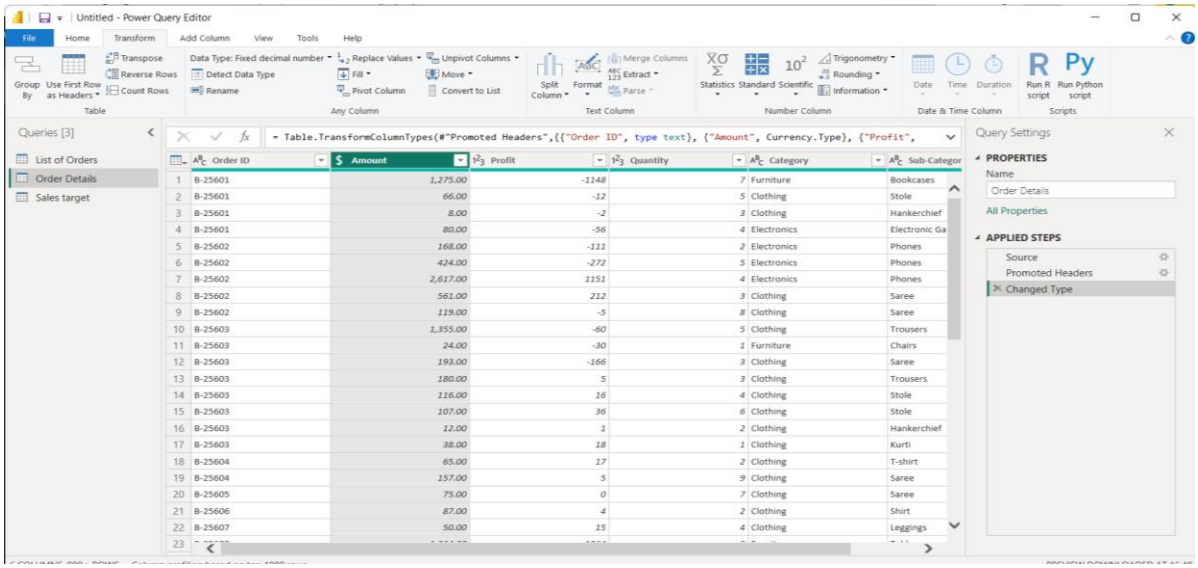

checking Order date whether it was in correct Data type

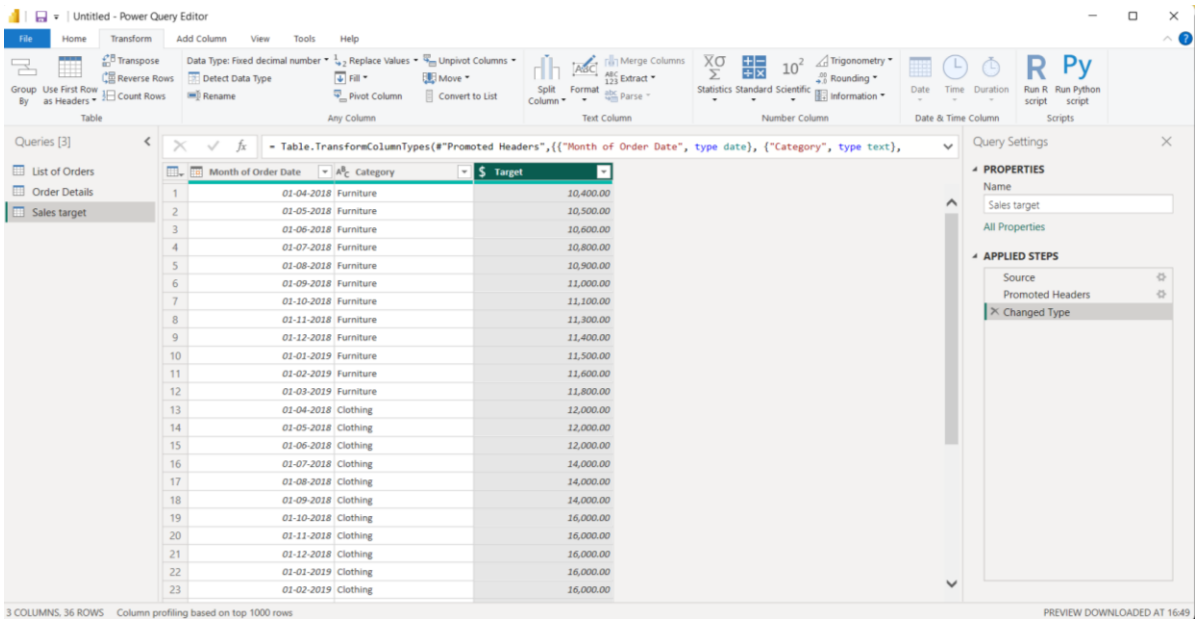

Step- 4

Covert customer into Proper by using capitalize each word

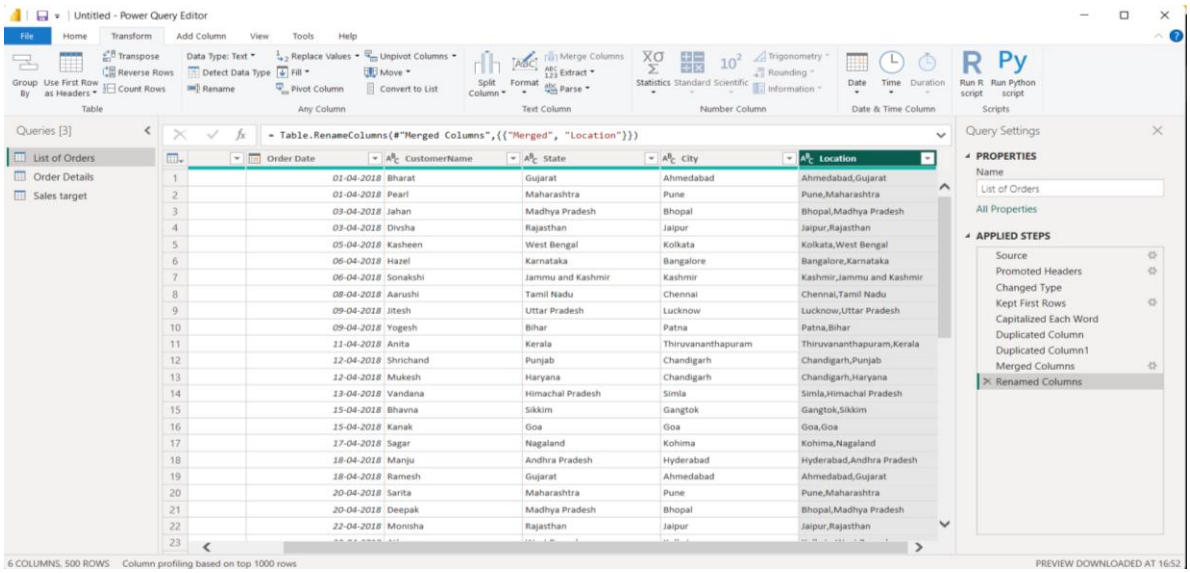

Step- 5

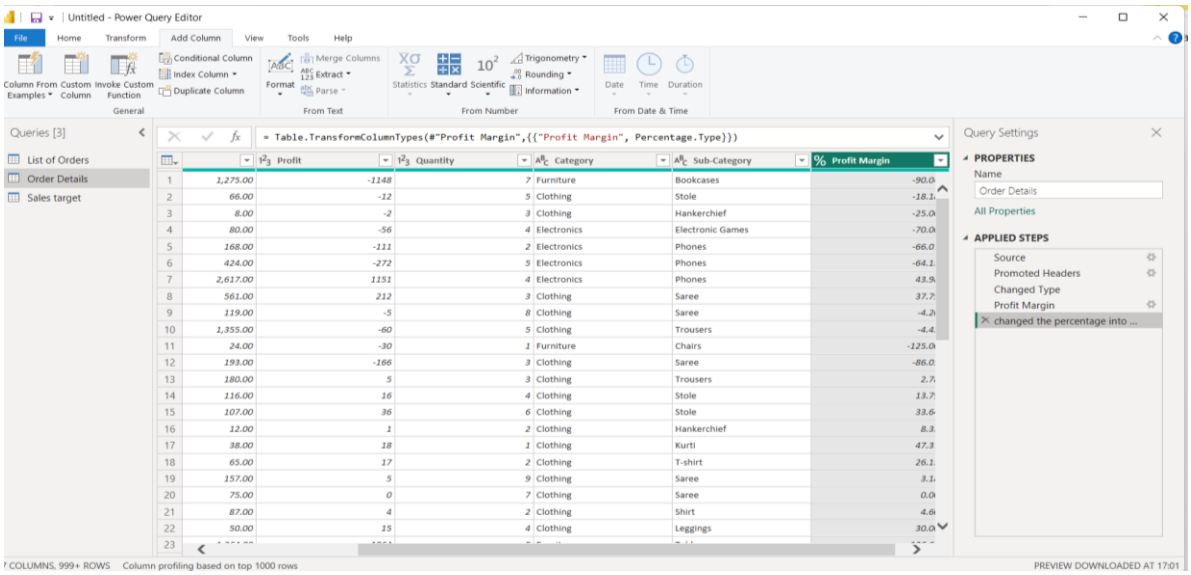

Covert Amount and Target into Fixed Decimal Number

Step- 6

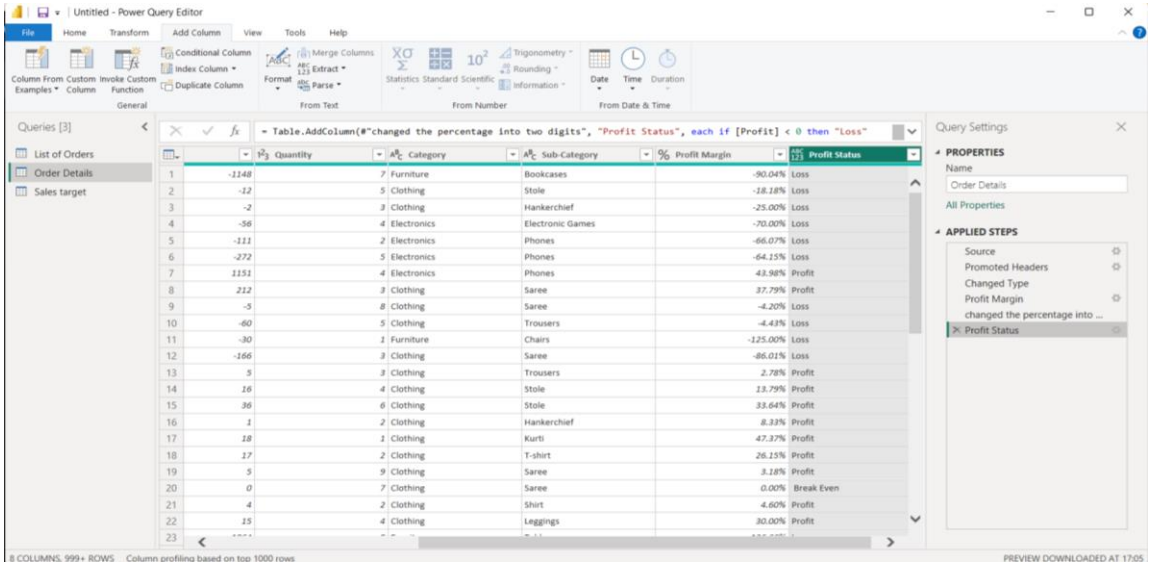

Created duplicate city and State column and using Merge column create a new column named location with the delimiter comma

Step- 7

Create new column using Custom column named as Profit Margin with Profit/ Amount

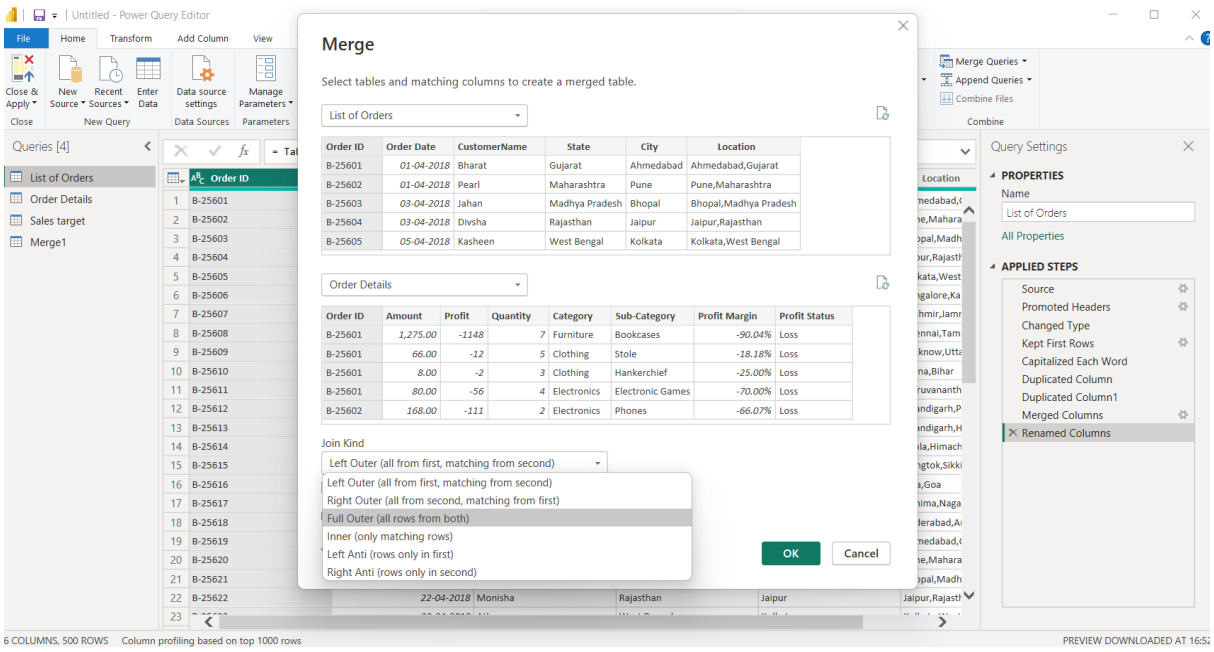

Step- 8

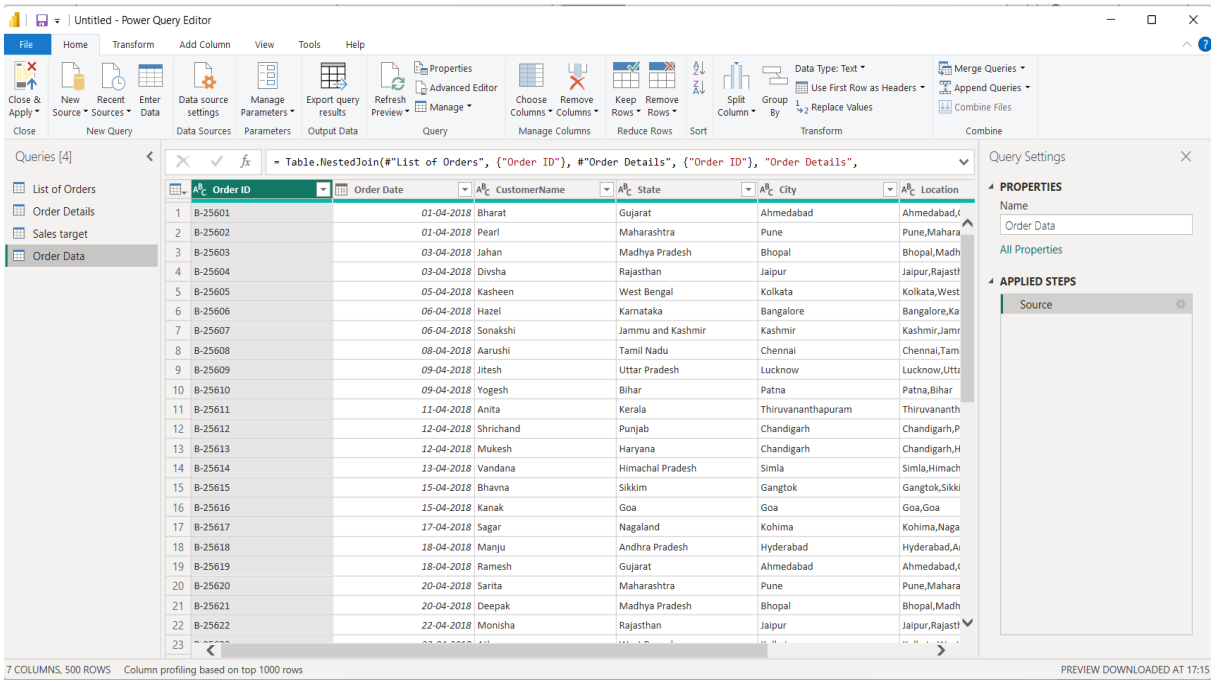

Create a conditional column named as Profit Status if the profit Less than 0 profit status should be Loss equals 0 Break even and Greater than 0 is Profit.

Step- 9

Merging data

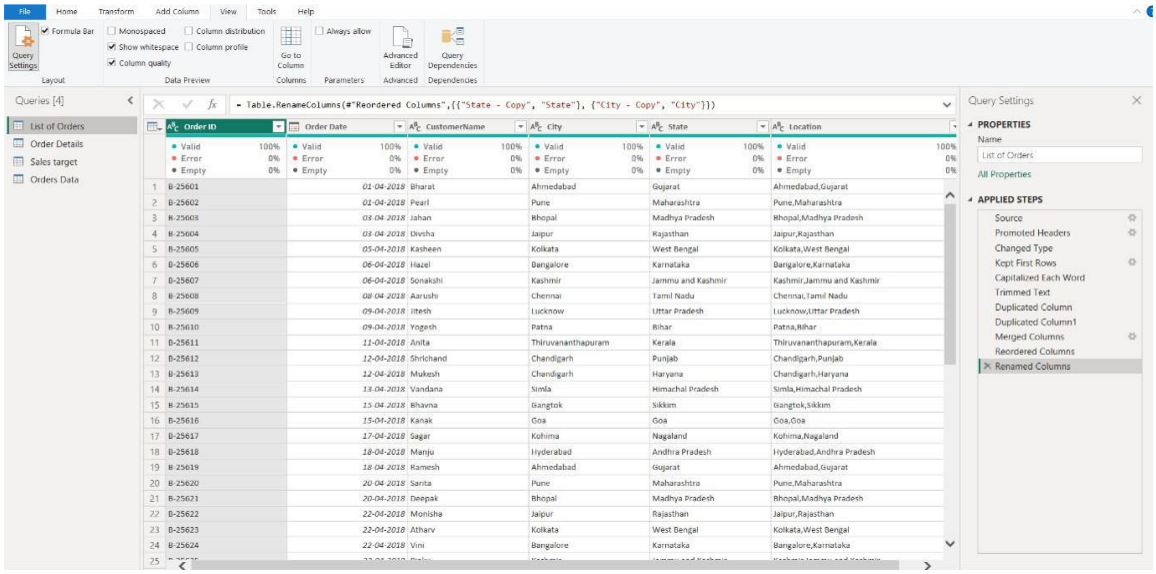

Using Merge queries merging list of orders and Order details Data into new Table named Order Data with the order ID relationship in Full outer

Step- 10

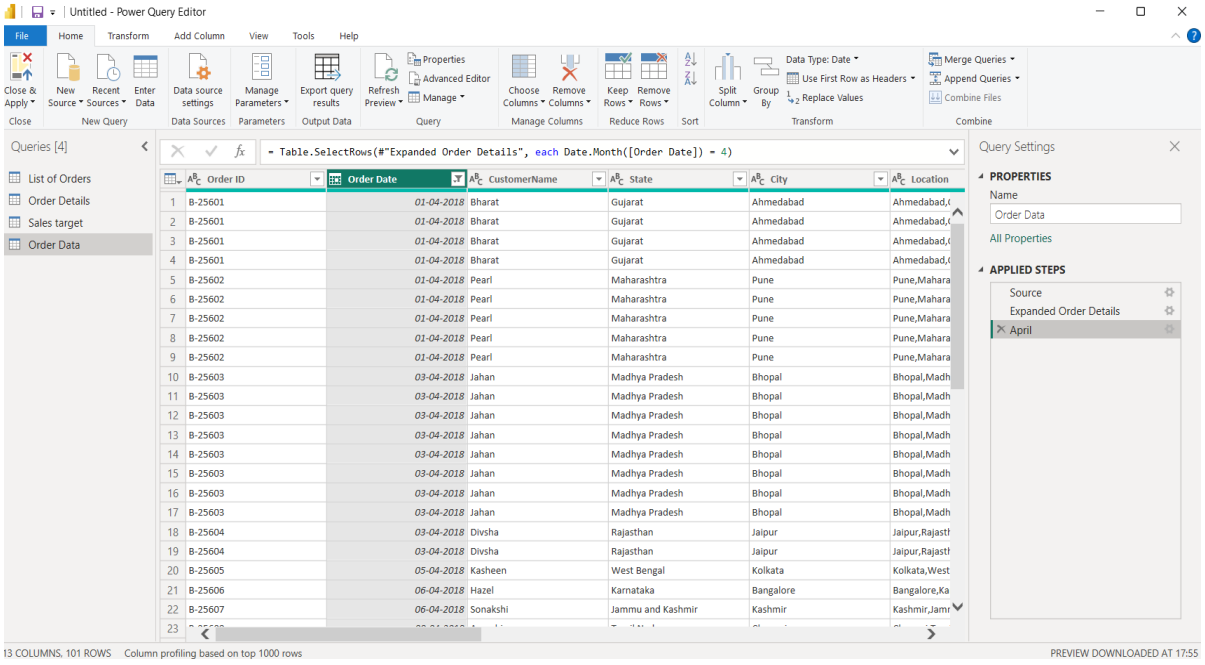

Handling Missing and Duplicate Data

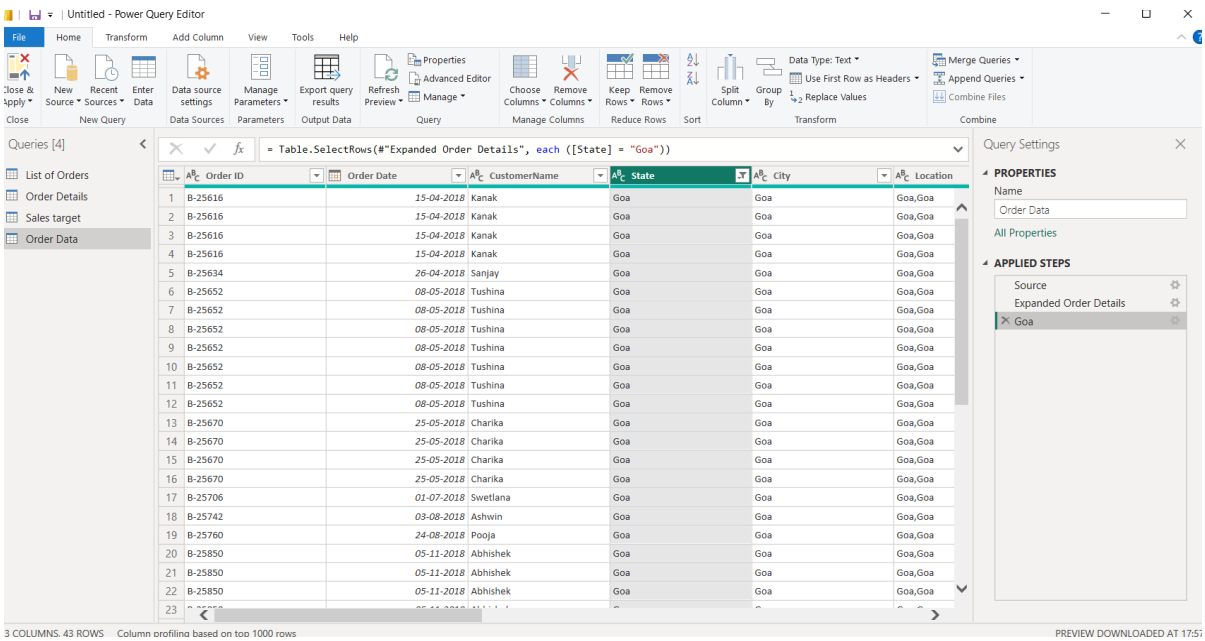

The NULL values are present in the last 60 rows of the During the above process , the of orders table is restricted to top 500 rows so the NULL valued rows are removed. Checking for Missing and duplicate data by sorting filtering for each rows no duplicate data found

Step- 11

Sorting and Filtering data

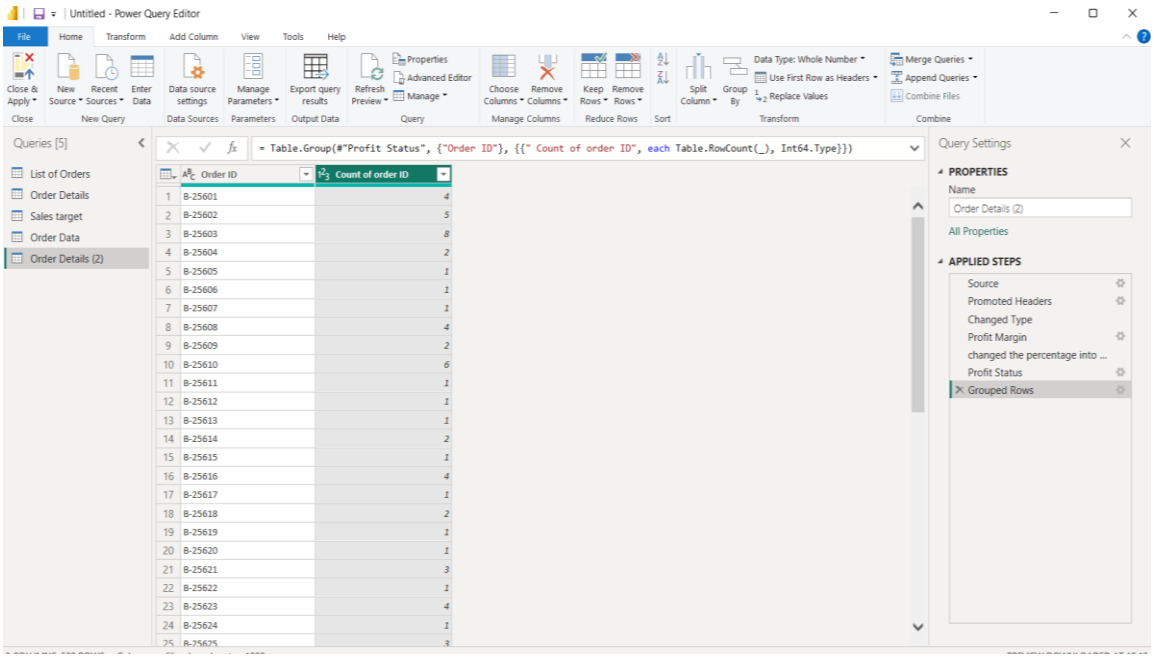

Filtered April month data to analyse each category in April Month

Filetered Goa state analyze Goa state Orders

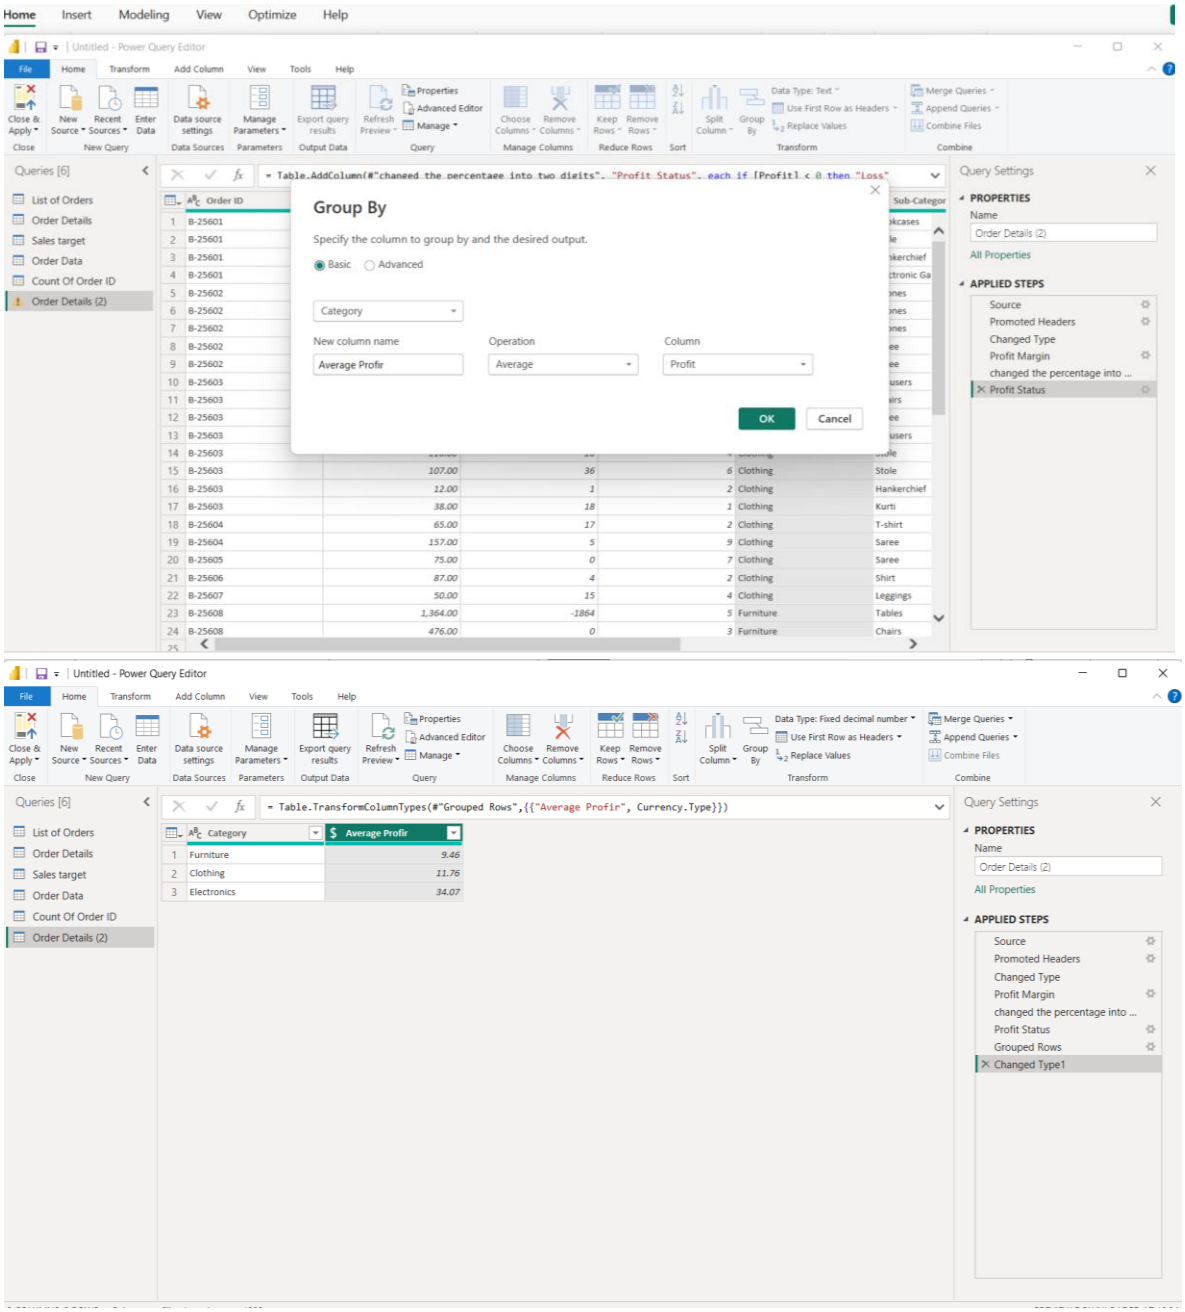

Step- 12

Grouping And Appending Data

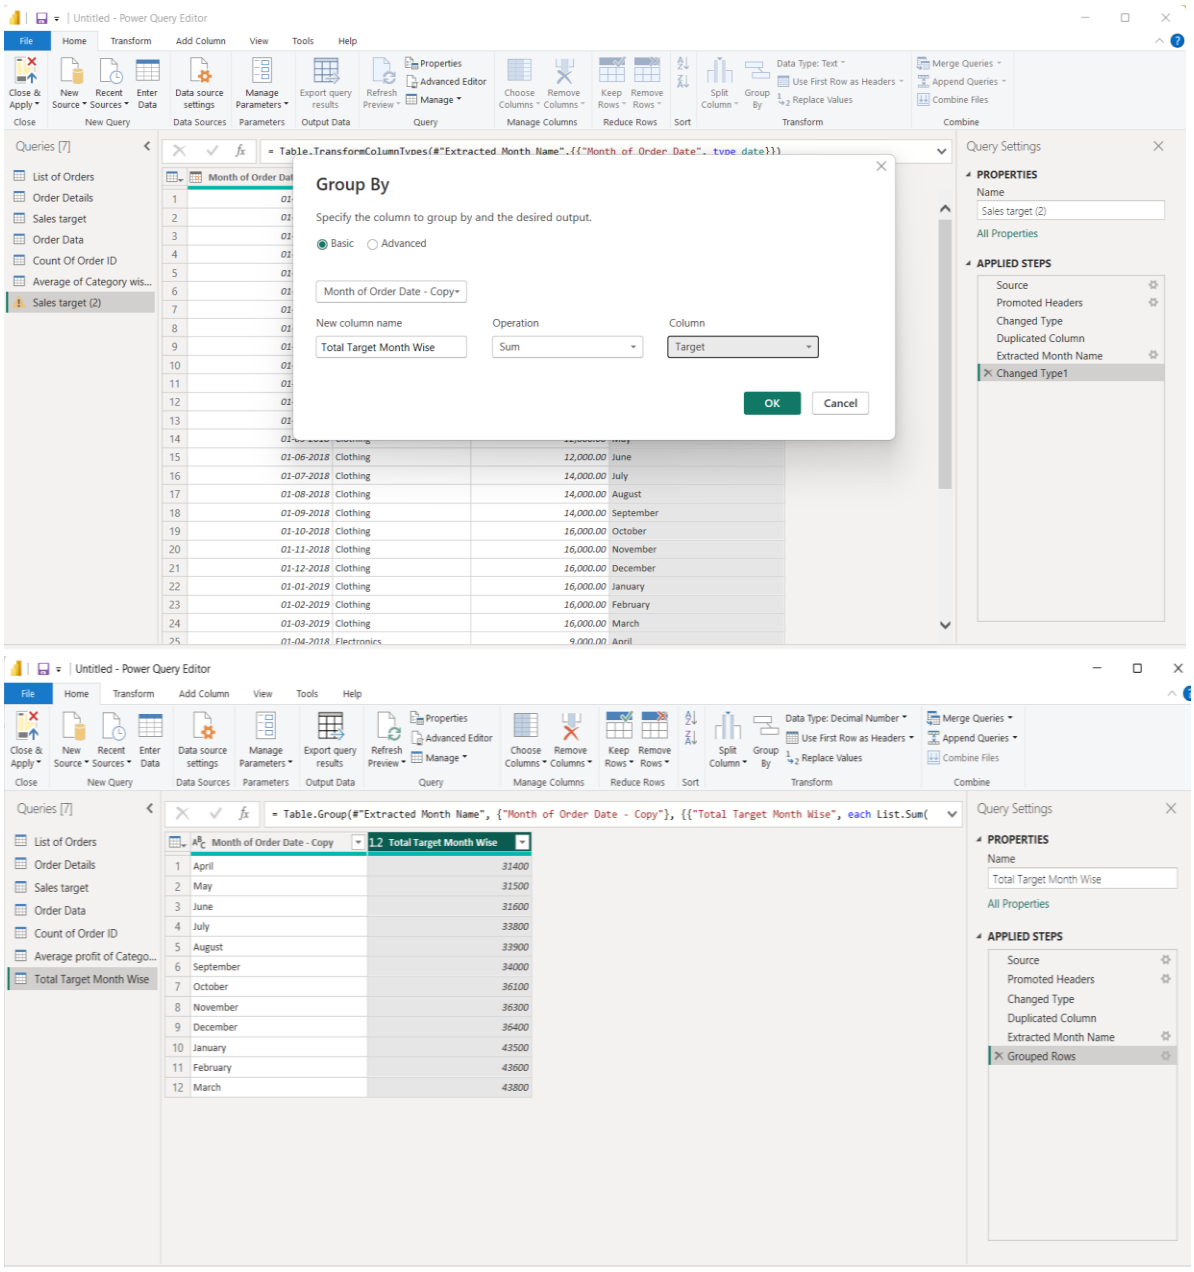

By using Group By Find the Count of the order id In Order details

Step- 13

Finding Average profit of Each category Using Group By category finding Average of Profit new column named as Category Profit

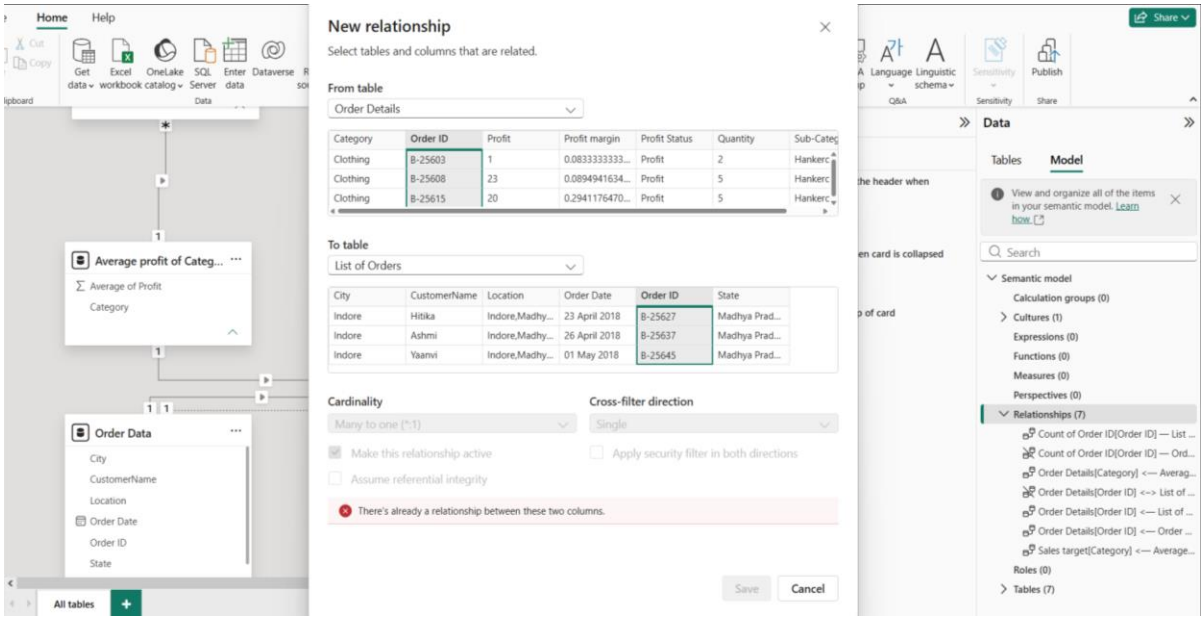

Step- 14

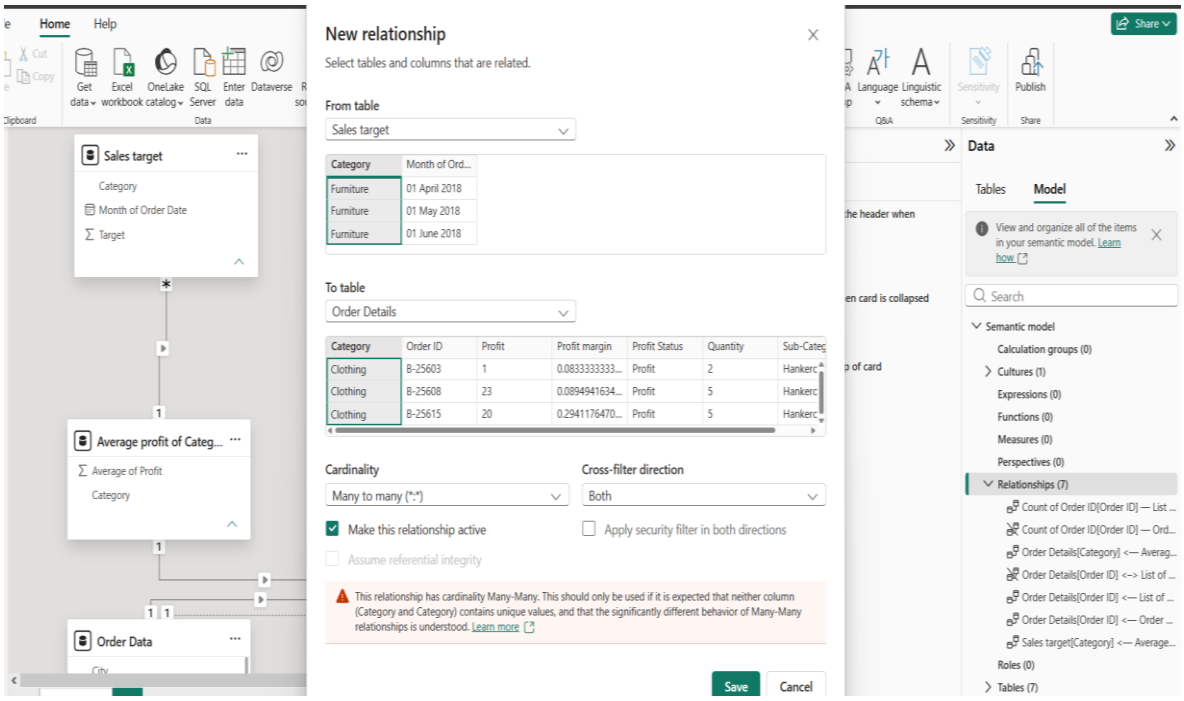

Duplicate the Sales details and using Group By Month of order finding sum of total order month Wise

Step- 15

Data Modelling

Finding the Relationship of List of Orders and order details with the Order ID

Finding the Relationship of list of order and S
